GUIDE TO AKWAS

(AUTHOR AND KEY WORDS IN ALPHA SEQUENCE)

A. Introduction

AKWAS, which provides subject and author access to AMR, is loosely based on indexing principles used for many years by Excerpta Medica, Amsterdam, one of the world's largest producers of printed Indexes. It also incorporates some features of WADEX (Word & Author InDEX) an experimental index of AMR.

Each review in this volume was indexed by a subject specialist. The indexing record was put into machine readable form and edited. Specially prepared computer programs were used to sort the entries and to generate the printed index through a Hendrix-Compugraphic typesetting system.

B. Vocabulary

The terms used in indexing are drawn from a controlled vocabulary, the List of Index Terms (LIT), prepared by AMR. This list is partially reproduced in the present volume. Terms not used for the 1981 index are not listed. Where the LIT did not contain all terms needed to fully describe a particular publication, the indexer could also use other terms. These additional free terms become candidates for inclusion in next year's LIT. The list also contains "see" and "see also" references.

In order to bring related topics together, some terms appear in an inverted form, e.g., "shells (cylindrical)" rather than "cylindrical shells". Certain LIT terms have been designated as "forbidden words" and are preceded by an asterisk. These are mostly non-specific terms that tend to occur rather frequently, such as "numerical results" or "theory". Forbidden words may also be terms which though not used frequently, would not be considered as search terms. The forbidden words do not generate subject entries in AKWAS, but appear as descriptive modifiers.

C. Description of Entry and Modifiers

The indexing terms may be single or composite. As many terms are used as are needed to describe a publication adequately. For each entry, all the LIT terms and free terms are arranged in a single alphabetical sequence followed by author(s) and item numbers as in the following example:

cardiovascular system, aortic valve, cavities, laminar flow, numerical methods, pipe flow, unsteady flow, valves, Gillani (N.V.), Swanson (W.M.), 3100

The string of subject terms in each group serves as a kind of "mini abstract" showing the major subject dealt with in the publication. The publication is also listed under several other entries, each additional entry being extracted from the above modifier group. The AKWAS is an alphabetically "rotated" index because most of the terms used to index a particular publication will be rotated alphabetically into the entry term position, the other terms appearing as modifiers in strict alphabetical sequence. Thus, the string of terms used in the previous example will generate the following additional subject entries:

cavities, aortic valve, cardiovascular system, laminar flow, numerical methods, pipe flow, unsteady flow, valves, Gillani (N.V.), Swanson (W.M.), 3100

Gillani (N.V.), aortic valve, cardiovascular system, cavities, laminar flow, numerical methods, pipe flow, unsteady flow, valves, Swanson (W.M.), 3100

laminar flow, aortic valve, cardiovascular system, cavities, numericai methods, pipe flow, unsteady flow, valves, Gillani (N.V.), Swanson (W.M.), 3100

Swanson (W.M.), see Gillani (N.V.), 3100

unsteady flow, aortic valve, cardiovascular system, cavities, laminar flow, numerical methods, pipe flow, valves, Gillani (N.V.), Swanson (W.M.), 3100

valves, aortic valve, cardiovascular system, cavities, laminar flow, numerical methods, pipe flow, unsteady flow, Gillani (N.V.), Swanson (W.M.), 3100

AKWAS is therefore a multi-access index since a publication indexed under multiple terms could conceivably appear under any one of them. There are two types of terms, however, that are never rotated into the entry term position—the free terms and the forbidden words. They are used only as modifiers and never generate their own entries. In the above example, the terms "numerical methods" and "pipe flow" are forbidden terms and "aortic valve" is a free term; thus, they do not appear as entries.

D. Formatting

1. Alphabetization Convention

The following convention was used: Space, parenthesis, period, hyphen, and apostrophe represent hypothetical letters preceding "a" in the alphabet; any other punctuation marks count as letters following the letter "z" in the alphabet.

2. Typography and Punctuation

A number of type faces have been employed in AKWAS to make it easier to use. All entry terms appear in bold face and all modifiers in a medium type font. Sanserif is used for names of authors and serif for subject terms. Item numbers appear in italics. (There is a total of five type fonts.)

Punctuation marks are avoided wherever possible, and capitalization is not used in subject terms; thus, Runge-Kutta Method appears as "runge-kutta method".

3. Multiple Entries

Publications listed under a single entry term are arranged in numerical sequence by their AMR review numbers. This is intended to aid the systematic searching of the annual volume of AMR and to reduce the need for the user to jump backwards and forwards from one monthly issue to another which would have been the case had an alphabetical sequencing by the first modifier been used.

Entry terms are not repeated. Instead, "bullets" are used in place of the entry term in the second and subsequent index entries, as in the example.

cardiovascular system, blood, cellular flow, Monti (R.), 1650

- cardiac output measurement, respiratory system, Homer (L.D.), Denysyk (B.), 1653
- aortic valve, cavities, laminar flow, numerical methods, pipe flow, unsteady flow, valves, Gillani (N.V.), Swanson (W.M.), 3100
- --- 4434
- --- 6282

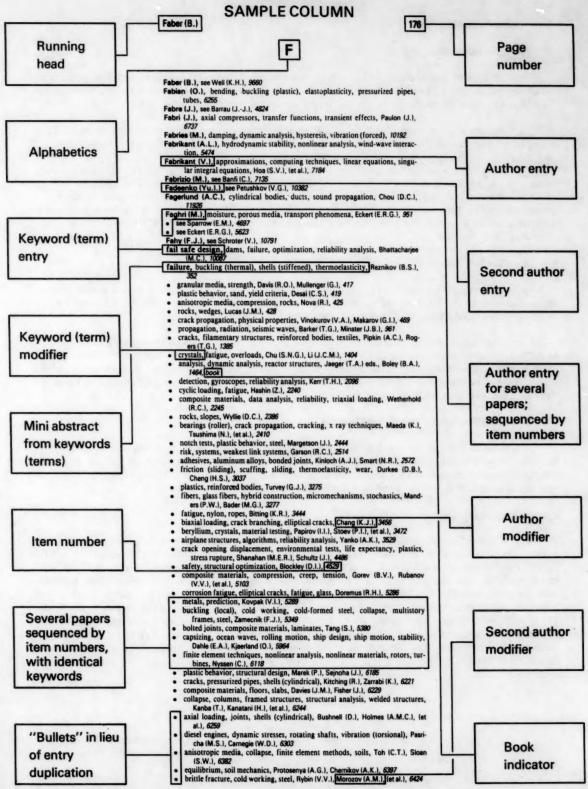

4. Running Heads

The first and last entry on a page is indicated with "running heads" on the upper left and right side of the page. If the first item on a page is "bulleted" then the left-hand running head is the last entry on the previous page. On those pages where only "bullets" appear (heavily used entry terms), the last entry on the previous page will be given on both left and right.

5. Sample Page

The figure indicates a sample column of AKWAS. The "legend" on the left-hand and right-hand side clarifies the elements of AKWAS.

AKWAJ

E. Search Strategy

1. Author Search

Names of authors, like subject entries, are listed alphabetically. In papers with two authors, the second author is referred to the first author with the word "see," name of first author and the item number. In papers with three or more authors, "et al." is used for the third and consecutive authors.

Authors using unlike initials in different publications are listed as in the journals. Thus, Jones (A.), and Jones (A.B.) might be the same individual.

Some problems can occur in the searching of Russian names in AKWAS due to different transliteration systems. AMR uses the ANSI standard for the transliteration of cyrillic names. This might be different from the transliteration used by journals that are translated cover-to-cover or by the Russian author whose paper appears in a Western journal. AMR uses Russian names published in Roman alphabet in the form as they are printed. Thus, a name beginning "Ia" might appear also as "Ya" or "Ja". Similiarly "Io" could appear as "Yo" or "Jo.".

2. Subject Search

In developing a search strategy, it will be useful to look first at the LIT since this tool contains cross-references among terms whose meanings are related. When initiating a search in AKWAS under a particular keyword (term), some modifiers may suggest alternate approaches.

Search time will be reduced by investigating the frequency with which the indexing terms are used in AKWAS, and beginning the search under the term that occurs least frequently. For example, when searching for publications dealing with cardiovascular systems, valves, and unsteady flow, the search should start under "cardiovascular system", which may appear in an AKWAS 7 times, as compared to 21 times for "valves", and 184 times for "unsteady flow."

3. Locating Publications by Item Number

The AKWAS search yields item numbers (printed in italics). In the case of a subject entry which has many bulleted items the item numbers will be consecutive and thus easily located. In the case of several subject entries and/or authors the Guide to Monthly Entries (located on Table of Contents page as well as on back cover) should be consulted to find in which monthly issue to look.

F. Acknowledgements

The "rotated" alphabetical index approach as used by Excerpta Medica, was suggested by AMR Consultant F. Wilfrid Lancaster, Professor of Library Science at the University of Illinois. He contributed significantly to the development of AKWAS and also to the production of guidelines for indexers. AKWAS also contains several features of the earlier AMR experimental index called WADEX. The design of the AKWAS system was performed by Dr. James M. Knox of CyberSearch. Dr. Ching Yew and Dr. Parker Lamb of the University of Texas at Austin provided valuable assistance with the development of this volume of AKWAS. The Publications Processing Unit of SwRI handled the computer typesetting under the direction of Mr. Don W. Moore and Mrs. Billie Ford; and Ms. Maureen Funnell of Southwest Research Center was responsible for copyreading. The names of the 19 indexers and all subject specialists are listed on the masthead page of this AKWAS.
